29 July 2026

Dear Hiring Manager,

I am Fydar Avery, a games programmer with **9 years** of hands-on **Unity** experience specialising in developer-facing tools, authoring workflows, and editor UX. Across **11 commercial titles**, my focus has consistently been on identifying friction in how developers use tools, designing solutions alongside the people who depend on them, and iterating against real user feedback.

I have a demonstrated track record of gathering requirements from artists, designers, and producers; aligning priorities across disciplines; scoping and driving cross-team delivery; presenting deliverables to stakeholders; and producing documentation and tutorials to ensure adoption. I understand that shipping a feature is only half the job – the other half is ensuring people can discover, learn, and benefit from it.

My technical background spans **authoring tools**, **systems**, **backend infrastructure**, **multiplayer**, **gameplay**, and **technical art**.

Thank you for your consideration.

Sincerely,

[/'faɪ.da:/'](https://fydar.dev/)

Professional Overview

Throughout my **9-year career** across studios from indie to AAA, I have consistently occupied a central, cross-disciplinary role – gravitating toward the tools, pipelines, and workflows that empower how teams create. The majority of my work has been in **Unity**, specialising in the editors, asset pipelines, and authoring tools developers depend on every day.

My technical contributions span [authoring tools](#), [systems](#), [backend infrastructure](#), [multiplayer](#), [gameplay](#), and [technical art](#). This breadth lets me evaluate various complex cross-system technology stacks and articulate technical concepts clearly to any audience from engineers to executives, and credibly collaborate with counterparts across diverse engineering teams – a foundation I now bring to product leadership.

Tools, Workflows & UX

As a Tools Programmer, I think of myself as a **"Workflow Engineer"**, responsible not just for technical delivery but for the full experience of the people using what I build.

My approach is **product-focused**. I gather requirements directly from artists, designers, and producers, design solutions alongside them, and iterate against their feedback. I am experienced in scoping, prioritising, facilitating cross-team communication, and presenting deliverables to stakeholders. I approach prioritisation by balancing user impact, technical feasibility, and business goals – making trade-offs transparent and driving alignment before work begins.

I take knowledge sharing seriously. A tool no one knows how to use is a tool that fails, so I regularly produce tutorial videos and documentation for end users alongside technical docs for other engineers. Facilitating that feedback loop is something I consider a core part of the job, not an afterthought.

I also believe in teaching teams what Unity already offers because often the best solution is helping developers get more out of existing tools, rather than building new ones. Knowing the **Unity Engine** deeply enough to make that call is a skill I have developed over decade using Unity, with my first Unity version being **Unity 4.1.2** in **2013**.
